AAZ69579 to AAZ77440 represent amplification primers for the biallelic markers. The biallelic markers of the invention primers to the stallelic markers. The biallelic markers of the invention have a variety of uses they can be used for high density mapping of the human genome, and in complex association studies and haplotyping studies which are useful in determining the genetic basis for disease states. Compositions and methods of the invention can also be useful for the compositions and methods of the invention can also be useful for the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            identification of the targets for the development of pharmaceutical agents and diagnostic methods, as well as the characterisation of the differential efficacious responses to and side effects from pharmaceutical agents acting on a disease as well as other treatment. ```

This sequence represents a fragment of the KALPA gene arou of a single nucleotide polymorphism (SNP). The KALPA gene chromosome 13 between markers D138265 and D138158. KALPA is

of the KALPA gene around the position

18

located on

D13S158. KALPA is a membrane element binding protein)

(sterol response

The KALPA protein contains five transmembrane domains in the N-terminal part of the protein and a TPR motif, which may be involved in protein-protein interactions, and preferably interacts with WD-40 repeat proteins. KALPA also contains an aldo-keto reductase (AKR) domain. The KALPA polypeptide may be used in the method of the invention for identifying a candidate cholesterol-lowering compound. The method comprises: providing a Kalpa polypeptide or its fragment by contacting the polypeptide with a test compound; providing a respective Kalpa-target polypeptide or its fragment; and determining whether a test compound selectively inhibits the ability of the polypeptide of step (1) to bind to the respective Kalpa-target polypeptide of step (2). The method is useful for identifying a candidate cholesterol-lowering compound for preparing a composition for treating cholesterol-related disorder
gene, such that the recommence to breast and ovarian cancerdeletion indicates a predisposition to breast and ovarian cancerdesent invention describes newly discovered deletion mutations in
                                                   This invention relates to a novel method for predicting a predisposition to cancer in a patient by detecting large deletions in the human tumour suppressor gene identified as the breast cancer susceptibility gene 1 (BRCA1). Specifically, it refers to deletions that result from the unequal crossover between a pair of repetitive Alu sequences in the BRCA1 gene, such that the recombined nucleotide sequence containing the deletion indicates a predisposition to breast and ovarian cancer. The
                                                                                                                                                                                                                                                                                                                 Predicting a predisposition to cancer in a patient comprising detecting deletion in the BRCA1 gene that results from the unequal crossover between a pair of repetitive sequences in the BRCA1 gene.

                                                                                             The invention relates to a system for detecting gene expression, which comprises one or two isolated DNA molecules that detect expression of a gene, where the gene corresponds to any of 8143 oligonucleotides (ABZ00010-ABZ08152) each having 50 base pairs (bp). The system is useful for leukocyte expression profiling. It is particularly useful for diagnosing a disease, monitoring (rate of) progression of a disease, predicting therapeutic outcome, determining prognosis for a patient, predicting disease complications in an individual or monitoring respons to treatment in an individual. The diseases include cardiac allograft rejection, kidney allograft rejection, liver allograft rejection, atherosclerosis, congestive heart failure, systemic lupus erythematosus the program of the systemic lupus erythematosus the systemic lupus
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               structure or biochemical function of BRCA1. Accordingly, it provides methods for detecting such mutants, as well as identifying and screening for cytostatic compounds useful for treating or preventing cancers associated with a BRCA1 genetic variant. This polynucleotide is a DNA fragment representing a junction sequence that arises as a result of a recombination event in human BRCA1 that causes the omission of exons 16 and 17, given in an exemplification of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               New system for leukocyte expression profiling, diagnosing a disease, or monitoring (the rate of) progression of a disease, e.g. atherosclerosis or congestive heart failure, comprises diagnostic oligonucleotides.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  20-OCT-2000;

                                                                                                                                                                                                                                      This is the nucleotide sequence for the PCR primer used in the amplification of the Alu repeat sequence, which is used to demonstrate the processes described in the invention. It involves the creation and use of circular yeast artificial chromosome (YAC) to selectively clone specific nucleic acids from a background of mixed nucleic acids by introducing the vector(s) into B. coli cells. They can be used to rapidly isolate human DNA where only a part of the sequence of DNA is known. Using the methods large fragments of DNA can be easily cloned and
                                                                                                                                                                                                                                                                                                                                                                            Preparation of yeast artificial chromosomes - by in vivo recombination using vector comprising yeast centromere, marker, yeast telomere and nucleic acid for recombination.

The method is used for making a YAC. The method is also used for selective cloning of mammalian, specifically human, nucleic acid from a population, particularly radiation hybrids that contain only a small fragment of a human chromosome. The present sequence represents an Alu PCR primer. It was used for inter-Alu PCR, to produce ALu profiles of YACs produced using the method of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         1. 1. 1. 1. 1.
                                                                                                                                                                                                                                                                                                                                                                                                                                                The specification describes a method for making a yeast artificial chromosome (YAC) that includes an origin of replication (ori). The method comprises incorporating into yeast cells: a population of mammalian nucleic acid; and a vector that comprises a yeast centromere, selection marker, yeast telomere and a sequence that recombines with a region of the nucleic acid, so that in vivo recombination to a YAC occurs. This the nucleic acid, so that in vivo recombination to a YAC occurs.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Preparing yeast artificial chromosomes, useful e.g. for cloning specific human nucleic acid, comprises recombination in yeast cells between a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             21-MAY-2002
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Synthetic.

Cone polymorphism in such drug metabolising enzyme-encoding genes. The colymorphism is such drug metabolising enzyme-encoding genes. The colymorphism specific for a sequence selected from ABZ43217-ABZ50887 using a covariety of detection assays, including hybridisation assays, nucleic acid covariety of detection assays, including hybridisation assays, nucleic acid covariety of detection assays, including hybridisation assays, nucleic acid covariety of detection assays, including hybridisation assays, nucleic acid covariaty and processory, including hybridisation assays, nucleic acid covariaty and processory acid polymorphism data. Genetic polymorphism data, particularly that relating to single nucleotide polymorphism and ata, particularly that relating to single nucleotide covariations and human diseases, conditions, and responses to covary and sequence variations and human diseases. SNPs are particularly useful in the above respects as they are stable in populations, occur can all comparts and have lower mutation rates than other genome variations and penes encoding drug metabolising enzymes allows the customisation of cover the respecting sequences. The detection and analysis of polymorphisms covariate particular partients of covariations and the particular partient, but would also reduce the likelihood of adverse reactions, the thereby increasing safety. Covariate particular partient, but would also covariate the invention are also useful in the drug discovery and caparoval processes. For example, individuals could be selected for colinical trials only if their genetic profiles indicate that they are caparoval processes. For example, individuals could be selected for colonical trials only if their genetic profiles indicate that they are consisted and compositions of the invention may therefore lead to a an increase in the range of consisted with more detections, falsed drug trials, the time taken for a drug to be approved, the length of time patient seeds to take before finding an effective therapy in the col

Identifying individuals having a polymorphism, useful for determining the effectiveness or side effect of a drug or treatment protocol, comprises detecting at least one polymorphism in the drug metabolizing enzyme

Claim 23; Page 70; 2785pp; English.

sequences ABZ43217-ABZ50887 represent polymorphic sites within genes cc encoding enzymes associated with drug metabolism. The invention relates cc to methods and compositions for identifying individuals who have at least compositions in such drug metabolising enzyme-encoding genes. The cc primers specific for a sequence selected from ABZ43217-ABZ50887 using a cyariety of detection assays, including hybridisation assays, nucleic acid arrays and PCR-based methods. The invention also encompasses methods of cevaluating and screening drugs using genetic polymorphism data, particularly that relating to single nucleotide cc polymorphism data, particularly that relating to single nucleotide complymorphism data, particularly that relating to single nucleotide complymorphism data, particularly that relating to single nucleotide complymorphism and so useful as polymorphism markers for discovering genes to drugs. SNPs are also useful as polymorphism markers for discovering genes complys. SNPs are also useful as polymorphism markers for discovering genes comply to a particular particularly useful in the above respects as they are stable in populations, occur such as repeating sequences. The detection and analysis of polymorphisms complymorphism sequences and have lower mutation rates than other genome variations of drug therapies based upon the genetic profile of individual patients. This would not only take the guesswork out of selecting the drug with the greatest therapeutic effect for a particular patient, but would also createst therapeutic effect for a particular patient, but would also reduce the likelihood of adverse reactions, thereby increasing safety. Methods of the invention are also useful in the drug discovery and compositions of the invention are also useful in the drug discovery and compositions of the invention may therefore lead to a an increase in the range of the invention of the inventions. The methods, data and compositions of the invention of the inventions of the inventions of the inventions of the in

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   possible drug targets and decreases in the number of adverse drug reactions, failed drug trials, the time taken for a drug to be approved, the length of time patients are on medication and the number of different medications a patient needs to take before finding an effective therapy
                                                                                                                                      The present invention relates to human nucleic acids containing single nucleotide polymorphisms (SNPs). These can be used in forensic and paternity tests, and to aid in the treatment of diseases associated with aberrant protein expression, including cancer, amyloidosis, diabetes, Alzheimer's disease, Down's syndrome, cedema, lupus (SLE), vasculitis, glomerulonephritis, haemolytic anaemia, thrombocytopaenia, arthritis, meningitis, muscular disorders, dementia, neurological diseases, tuberous sclerosis, male infertility, hypercalcaemia, blood pressure disorders, osteoporosis, pathogenic infections, hypercholesterolaemia, obesity or autoimmunity. The present sequence is a polymorphism-containing oligonucleotide fragment of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 07-JAN-2000; 2000US-0174962P
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      WO200151670-A2
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Homo sapiens

                                                                                                                                                                                                                                                                                                                                                                Query Match
                                                                                                                                                                                                                                                                                                                                                                                                                                                   The present invention relates to a neural thread protein (NTP) peptide referred to as cell death peptide. Thought to be cycostatic, antibacterial, immunosuppressive and antiinflammatory. It is useful for treating a condition in a patient requiring removal or destruction of cells, for treating a condition such as benign or malignant tumor, inflammatory disease, autoimmune disease and infectious disease. The peptide useful for treatment is derived from the amino acid sequence for a pancreatic thread protein. The peptide is conjugated, linked or bound to a molecule chosen from antibody or its fragment, antibody-like binding molecule, where the molecule has a higher affinity for binding to a tumor or other target than binding to other cells. Treatment using NTP peptides can remove benign tumors with less risk and fewer of the undesirable side effects of surgery. The present sequence is an NTP encoding sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                19-JUL-2001;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        antibacterial, immunosuppressive and antiinflammatory. It is useful for treating a condition in a patient requiring removal or destruction of cells, for treating a condition such as benign or malignant tumor, inflammatory disease, autoimmune disease and infectious disease. The peptide useful for treatment is derived from the amino acid sequence for a pancreatic thread protein. The peptide is conjugated, linked or bound to a molecule chosen from antibody or its fragment, antibody-like binding molecule, where the molecule has a higher affinity for binding to a tumor or other target than binding to other cells. Treatment using NTP peptides can remove benign tumors with less risk and fewer of the undesirable side effects of surgery. The present sequence is an NTP encoding sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          19-JUL-2001;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The invention relates to human uteroglobin 9 (AAM549078), nucleic acids encoding it (ABA96807), and a method for the recombinant production of uteroglobin 9. The protein has a molecular weight of 9 kD. The present invention additionally discloses an antagonist of uteroglobin 9 for therapeutic use, and an antibody which specifically binds to uteroglobin 9. Uteroglobin 9, and nucleotides which encode it may be used for treating a variety of diseases, such as malignant tumours, blood diseases, HIV (human immunodeficiency virus) infection, immune disorders and inflammatory conditions. The protein may also be used to screen for modulators of its activity or for peptide fingerprinting identification. The polynucleotide can be used as a primer for nucleic acid amplification reactions or as a probe for hybridisation reactions, or in producing gene chips or microarrays. Sequences ABA96812-ABA96813 represent human uteroglobin 9 probes used in an exemplification of the invention

The protein has a molecular weight of 9 kD. The present invention additionally discloses an antagonist of uteroglobin 9 for therapeutic use, and an antibody which specifically binds to uteroglobin 9. Uteroglobin 9, and nucleotides which encode it may be used for treating a variety of diseases, such as malignant tumours, blood diseases, HIV (human immunodeficiency virus) infection, immune disorders and infinite months.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Sequence 41 BP; 4 A; 10 C; 13 G; 14 T; 0 U; 0 Other;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       and inflammatory conditions. The protein may also be used to screen for modulators of its activity or for peptide fingerprinting identification. The polynucleotide can be used as a primer for nucleic acid amplification reactions or as a probe for hybridisation reactions, or in producing gene
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Example 6; Page 19; 35pp; Chinese
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Human uteroglobin 9 and encoding polynucleotide, used in diagnosis and treatment of malignant tumors, hemopathy, human immunodeficiency virus infection, immunological diseases and inflammation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             WPI; 2002-090430/12
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          chips or microarrays. Sequences ABA96812-ABA96813 represent humanuteroglobin 9 probes used in an exemplification of the invention

```
Identifying individuals having a polymorphism, useful for determining the effectiveness or side effect of a drug or treatment protocol, comprises detecting at least one polymorphism in the drug metabolizing enzyme mucleic acid.
```

2785pp; English

CC evaluating and screening drugs using genetic polymorphism data. Genetic CC polymorphism data, particularly that relating to single nucleotide CC polymorphisms (SNPs), may be used in studying the relationship between CC DNA sequence variations and human diseases. Conditions, and responses to CC drugs. SNPs are also useful as polymorphism markers for discovering genes that cause or exacerbate certain diseases. SNPs are particularly useful in the above respects as they are stable in populations, occur frequently, and have lower mutation rates than other genome variations of in genes encoding drug metabolising enzymes allows the customisation of CC drug therapies based upon the genetic profile of individual patients. CC This would not only take the guesswork out of selecting the drug with the CC greatest therapeutic effect for a particular patient, but would also CC reduce the likelihood of adverse reactions, thereby increasing safety. CC dinical trials only if their genetic profiles indicate that they are CC clinical trials only if their genetic profiles indicate that they are capable of responding to a particular drug ordrug class, and previously failed drug candidates could be revived if they were matched with more capable drug trials, the time taken for a drug to be approved, the length of time patients are on medication and the number of different medications a patient needs to take before finding an effective therapy tx one polymorphism in such drug metabolising enzyme-encoding genes. The polymorphisms may be identified in a nucleic acid sample using probes or primers specific for a sequence selected from ABZ4217-ABZ50887 using a variety of detection assays, including hybridisation assays, nucleic acid arrays and PCR-based methods. The invention also encompasses methods of Sequences ABZ43217-ABZ50887 represent polymorphic sites within genes encoding enzymes associated with drug metabolism. The invention relates to methods and compositions for identifying individuals who have at least Sequence 41 BP; 7 A; 16 C; 7 G; 11 T; 0 U; 0 Other;

                                                                                                                                                        Ş
                                                                                                                                                                                                                                                                                                       Sequences ABZ43217-ABZ50887 represent polymorphic sites within genes cencoding enzymes associated with drug metabolism. The invention relates to methods and compositions for identifying individuals who have at least cone polymorphism in such drug metabolising enzyme-encoding genes. The copymorphisms may be identified in a nucleic acid sample using probes or primers specific for a sequence selected from ABZ4217-ABZ50887 using a copymorphism data, particularly that relating to single nucleic acid evaluating and screening drugs using genetic polymorphism data. Genetic copymorphism data, particularly that relating to single nucleotide copymorphism data, genetic polymorphism data cause or exacerbate certain diseases. SNPs are particularly useful copymorphism strates than other genome variations and have lower mutation rates than other genome variations of that cause or exacerbate certain diseases. SNPs are particularly useful copymorphisms of genes encoding drug metabolising enzymes allows the customisation of corrections of the rappear dupymorphisms of polymorphisms of polymorphisms of genes encoding drug metabolising enzymes allows the customisation of corrections of adverse reactions, thereby increasing safety. Corrections of the invention are also useful in the drug discovery and approval processes. For example, individuals could be selected for capaboroval processes. For example, individuals could be selected for different copymorphisms of the patients are on methods, data and compositions of the inventions of the patients are on medication and the number of different medications, failed drug trials to take before fi

Specifically, it refers to deletions that result from the unequal crossover between a pair of repetitive Alu sequences in the BRCA1 gene, such that the recombined nucleotide sequence containing the deletion indicates a predisposition to breast and ovarian cancer. The
                                                                                                                                                                                                                                                                                                                                                                                                                                                present invention describes newly discovered deletion mutations that are believed to be deleterious and cause significant alterations in the structure or biochemical function of BRCA1. Accordingly, it provides methods for detecting such mutants, as well as identifying and screening for cytostatic compounds useful for treating or preventing cancers associated with a BRCA1 genetic variant. This polynucleotide is a DNA fragment representing a junction sequence that arises as a result of a fecombination event in human BRCA1 that causes the omission of exons 16

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      AA265654 to AA269578 represent human biallelic markers from the present invention, which contain a polymorphic base at position 24 of their nucleotide sequences. AA269579 to AA277440 represent amplification primers for the biallelic markers. The biallelic markers of the invention have a variety of uses: they can be used for high density mapping of the human genome, and in complex association studies and haplotyping studies which are useful in determining the genetic basis for disease states. Compositions and methods of the invention can also be useful for the identification of the targets for the development of pharmaceutical agents and disgrastic methods, as well as the characterisation of the differential efficacious responses to and side effects from
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                haplotyping; hybridisation; identification; characterisation; diagnosis; single nucleotide polymorphism; SNP; ds.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Novel biallelic markers used to construct a high density disequilibrium

ct that cause of cadethate certain disease. Save all particularly certain control of the above respects as they are stable in populations, occur can the above respects as they are stable in populations of polymorphisms con such as repeating sequences. The detection and analysis of polymorphisms con in genes encoding drug metabolising enzymes allows the customisation of cingens encoding drug metabolising enzymes allows the customisation of conflict only take the guesswork out of selecting the drug with the conflict of the likelihood of adverse reactions, thereby increasing safety. Consider the likelihood of adverse reactions, thereby increasing safety. Confided the invention are also useful in the drug discovery and comportant processes. For example, individuals could be selected for comproval processes. For example, individuals could be selected for comproval processes. For example, individuals could be selected for compable of responding to a particular drug or drug class, and previously contained the populations. The methods, data and compositions of the invention may therefore lead to a na increase in the rumber of adverse drug creations, failed drug trials, the time taken for a drug to be approved, the length of time patients are on medication and the number of different confidence in the rumber of adverse drug to the length of time patients are on medication and the number of different confidence in the rumber of adverse of the length of time patients are on medication and the number of different confidence in the rumber of the particular confidence in the rumber of adverse drug to be approved.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Key

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    one polymorphisms may be identified in a nucleic acid sample using probes or primers specific for a sequence selected from ABZA3217-RAE50887 using a rvariety of detection assays, including hybridisation assays, nucleic acid arrays and PCR-based methods. The invention also encompasses methods of evaluating and screening drugs using genetic polymorphism data, particularly that relating to single nucleotide polymorphism (SNPs), may be used in studying the relationship between DNA sequence variations and human diseases, conditions, and responses to drugs. SNPs are also useful as polymorphism markers for discovering genes that cause or exacerbate certain diseases. SNPs are particularly useful
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Sequences ABZ43217-ABZ50887 represent polymorphic sites within genes encoding enzymes associated with drug metabolism. The invention rela
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Identifying individuals having a polymorphism, useful for determining the effectiveness or side effect of a drug or treatment protocol, comprises detecting at least one polymorphism in the drug metabolizing enzyme
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Nakamura Y,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       27-DEC-2000; 2000JP-00399443

                                                                             variety of detection assays, including hybridisation assays, nucleic acid contrary and pCR-based methods. The invention also encompasses methods of evaluating and screening drugs using genetic polymorphism data, particularly that relating to single nucleotide polymorphism data, particularly that relating to single nucleotide polymorphisms (SNPs), may be used in studying the relationship between CC DNA sequence variations and human diseases, conditions, and responses to drugs. SNPs are also useful as polymorphism markers for discovering genes that cause or exacerbate certain diseases. SNPs are particularly useful in the above respects as they are stable in populations, occur frequently, and have lower mutation rates than other genome variations cuch as repeating sequences. The detection and analysis of polymorphisms in genes encoding drug metabolising enzymes allows the customisation of CC drug therapies based upon the genetic profile of individual patients. This would not only take the guesswork out of selecting the drug with the CC greatest therapeutic effect for a particular patient, but would also reduce the likelihood of adverse reactions, thereby increasing safety.

Methods of the invention are also useful in the drug discovery and control of course and the could be selected for
                                                                                                                                                                                                                                                                                                                                                                                                                                     to methods and compositions for identifying individuals who have at least one polymorphism in such drug metabolising enzyme-encoding genes. The polymorphisms may be identified in a nucleic acid sample using probes or primers specific for a sequence selected from ABZ43217-ABZ50887 using a variety of detection assays, including hybridisation assays
approval processes. For example, individuals could be selected for clinical trials only if their genetic profiles indicate that they are capable of responding to a particular drug or drug class, and previous failed drug candidates could be revived if they were matched with more failed drug candidates could be revived if they were matched with more
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Sequences ABZ43217-ABZ50887 represent polymorphic sites within g encoding enzymes associated with drug metabolism. The invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Identifying individuals having a polymorphism, useful for determining the effectiveness or side effect of a drug or treatment protocol, comprises detecting at least one polymorphism in the drug metabolizing enzyme
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Nakamura Y,

SNPs are also useful as polymorphism markers for discovering genes CC that cause or exacerbate certain diseases. SNPs are particularly useful CC in the above respects as they are stable in populations, occur frequently, and have lower mutation rates than other genome variations as uch as repeating sequences. The detection and analysis of polymorphisms CC in genes encoding drug metabolising enzymes allows the customisation of CC drug therapeutic effect for a puricular patient, but would not only take the guesswork out of selecting the drug with the CC greatest therapeutic effect for a particular patient, but would also CC reduce the likelihood of adverse reactions, thereby increasing safety. CC the invention are also useful in the drug discovery and CC approval processes. For example, individuals could be selected for CC capable of responding to a particular drug ording that they are CC appropriate patient populations. The methods, data and compositions of the invention may therefore lead to an increase in the range of CC possible drug triags and decreases in the number of adverse drug che length of time patients are on medication and the number of different medications a patient needs to take before finding an effective therapy var

Identifying individuals having a polymorphism, useful for determining effectiveness or side effect of a drug or treatment protocol, comprise detecting at least one polymorphism in the drug metabolizing enzyme nucleic acid.

Claim 23; Page 197; 2785pp; English.

CC variety of detection assays, including hybridisation assays, nucleic acid carrays and pCR-based methods. The invention also encompasses methods of CC arrays and pCR-based methods. The invention also encompasses methods of CC polymorphism data, particularly that relating to single nucleotide polymorphism so (SNPs), may be used in studying the relationship between CC polymorphisms (SNPs), may be used in studying the relationship between CC DNA sequence variations and human diseases, conditions, and responses to that cause or exacerbate certain diseases, conditions, and responses to CC that cause or exacerbate certain diseases. SNPs are particularly useful cin the above respects as they are stable in populations, occur congresses encoding drug metabolising enzymes allows the customisation of CC greatest therapeutic effect for a particular partient polymorphisms CC in genes encoding drug metabolising enzymes allows the customisation of CC greatest therapeutic effect for a particular patient, but would also creduce the likelihood of adverse reactions, the drug with the CC greatest therapeutic effect for a particular patient, but would also ccur reduce the likelihood of adverse reactions, thereby increasing safety. CC enable of responding to a particular drug or drug class, and previously cfailed drug candidates could be revived if they were matched for capable of responding to a particular drug or drug class, and previously cfailed drug trials, the time taken for a drug to be approved, the length of time patients are on medication and the number of different medications a patient needs to take before finding an effective therapy or medications a patient needs to take before finding an effective therapy or consistent patient needs to take before finding an effective therapy or consistent provious thereby increases in the number of different medications a patient needs to take before finding an effective therapy or the patient provious therapy is a patient or take before finding an effective therapy or consistent p one polymorphism in such drug metabolising enzyme-encoding genes. The polymorphisms may be identified in a nucleic acid sample using probes primers specific for a sequence selected from ABZ43217-ABZ50887 using Sequences ABZ43217-ABZ50887 represent polymorphic sites within general encoding enzymes associated with drug metabolism. The invention related methods and compositions for identifying individuals who have at genes relates least õ

Human NDUFS1 gene polymorphic site, #907.

Human; drug metabolising enzyme; gene; drug metabolism; chromosome polymorphic site; drug evaluation; drug screening; genotyping;

```
Sequences ABZ43217-ABZ50887 represent polymorphic sites within genes cencoding enzymes associated with drug metabolism. The invention relates to methods and compositions for identifying individuals who have at least cone polymorphism in such drug metabolising enzyme-encoding genes. The polymorphisms may be identified in a nucleic acid sample using probes or primers specific for a sequence selected from ABZ43217-ABZ50887 using a carrays and pCR-based methods. The invention also encompasses methods of evaluating and screening drugs using genetic polymorphism data, particularly that relating to single nuclected colymorphism data, particularly that relating to single nucleotide polymorphisms (SNPs), may be used in studying the relationship between CR polymorphisms (SNPs), may be used in studying the relationship between CR polymorphisms are also useful as polymorphism markers for discovering genes to that cause or exacerbate certain diseases, SNPs are particularly useful cin the above respects as they are stable in populations, cocur frequently, and have lower mutation rates than other genome variations come such as repeating sequences. The detection and analysis of polymorphisms come in genes encoding drug metabolising enzymes allows the customisation of CR drug therapies based upon the genetic profile of individual patients. CR mis would not only take the guesswork out of selecting the drug with the greatest therapies based upon the genetic profile of individual patients. CR mis would not only take the guesswork out of selecting the drug with the greatest therapies based upon the genetic profile of individual patients.

CR methods of the invention are also useful in the drug discovery and approval processes. For example, individuals could be selected for cindal patient populations. The methods data and compositions of the invention may therefore lead to a an increase in the range of the inventions of the methods. Adata and compositions of the inventions of the methods of adverse drug to be approved.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Identifying individuals having a polymorphism, useful for determining effectiveness or side effect of a drug or treatment protocol, comprise detecting at least one polymorphism in the drug metabolizing enzyme

CC sequences ABZ43217-ABZ50887 represent polymorphic sites within genes conding enzymes associated with drug metabolism. The invention relates cone polymorphism in such drug metabolising enzyme-encoding genes. The polymorphism shape identified in a nucleic acid sample using probes or complymorphism in such drug metabolising enzyme-encoding genes. The polymorphism shape identified in a nucleic acid sample using probes or complymorphism data, particularly their relation assays, nucleic acid carays and pcR-based methods. The invention also encompasses methods of cevaluating and screening drugs using genetic polymorphism data. Genetic polymorphism data, particularly that relating to single nucleotide complymorphism solutions and human diseases, conditions, and responses to drugs. SNPs are also useful as polymorphism markers for discovering genes conditions and human diseases. SNPs are particularly useful compasses or exacerbate certain diseases. SNPs are particularly useful in the above respects as they are stable in populations, occur frequently, and have lower mutation rates than other genome variations such human diseases. SNPs are particularly useful cause or exacerbate certain diseases. SNPs are particularly useful in the above respects as they are stable in populations, occur frequently, and have lower mutation rates than other genome variations genes encoding drug metabolising enzymes allows the customisation of drug therapeutic effect for a particular patient, but would also creduce the likelihood of adverse reactions, thereby increasing safety. Cc methods of the invention are also useful in the drug discovery and aproval processes. For example, individuals could be selected for capatroyriate patient populations. The methods, data and compositions of the lumpth of time patients are on medication and the number of different medications a patient needs to take before finding an effective therapy of different medications and the number of different medications and the number of different medications and the nu

                                                                                      Query Match
                                                                                                                                                               A method has been developed for detecting the presence of a target site (TS), of at least one nucleotide (nt) in a nucleic acid (NA). The method comprises: (a) forming an oligonucleotide (ON), consisting of two fluorophores (F1, F2) each covalently linked to separate nt, bound to TS; and (b) detecting fluorescence energy transfer (FET) between F1 and F2 when ON is released from TS. The present sequence represents a synthetic polynucleotide used in an example of the present invention. The method is used to diagnose hereditary and other diseases; to determine infectious agents; in tissue typing for histocompatibility; in forensic identification and paternity testing, and in monitoring the genetic make up of plants and animals. Specifically it is used to detect single nt polymorphisms. The method provides inexpensive, simple, accurate and

It involves the creation and use of circular yeast artificial chromosome (YAC) to selectively clone specific nucleic acids from a background of mixed nucleic acids by introducing the vector(s) into E. coli cells. They can be used to rapidly isolate human DNA where only a part of the sequence of DNA is known. Using the methods large fragments of DNA can be easily cloned and

method, designated transformation-associated recombination, eliminates the need for an in vitro ligation step, and makes possible selective cloning of cDNAs for which only the 3'-sequence is known. The method is used for making a YAC. The method is also used for selective cloning of mammalian, specifically human, nucleic acid from a population, particularly radiation hybrids that contain only a small fragment of a human chromosome. The present sequence represents an Alu PCR primer. It was used for inter-Alu PCR, to produce ALu profiles of YACs produced
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      chromosome (YAC) that includes an origin of replication (ori). The metl comprises incorporating into yeast cells: a population of mammalian nucleic acid, and a vector that comprises a yeast centromere, selection marker, yeast telomere and a sequence that recombines with a region of the property of the control of the control of the property of the p
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Preparing yeast artificial chromosomes, useful e.g. for cloning specific human nucleic acid, comprises recombination in yeast cells between a nucleic acid and a yeast vector.
                                                                                              using the method
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The specification describes a method for

DNA mismatch repair protein 11 and encoded polynucleotide, diagnosis and treatment of malignant tumor, hemopathy, HIV immunological diseases and various inflammation. applicable infection, ä

Example

36pp;

Chinese.

The present invention provides the protein and coding sequences of human DNA mismatch repair protein 11. The sequences are useful in the treatment of cancer, haemopathy, HIV infection, immunological diseases and inflammation. The present sequence is a probe for the coding sequence of

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Sequence 41
                                                                                                                                                                                                                                 The invention relates to a novel human transcription regulation factor ZFM1 isomer 19.47 and polynucleotides encoding the protein. The protein can be expressed by standard recombinant methodology. The protein and encoding polynucleotides are used in diagnosis and treatment of malignar tumours, haemopathy, HIV infection, immunological diseases and inflammation. The present sequence represents the human transcription regulation factor ZFM1 isomer 19.47 cDNA specific probe
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Transcription regulation factor ZFM1

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         RESULT 190
                                                                                                                                                                           Matches
                                                                                                                                                                                                                   Query Match
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     13
                                                                                                                                                                                                                                                                                                   The invention relates to a novel human transcription regulation factor ZFM1 isomer 19.47 and polynucleotides encoding the protein. The protein can be expressed by standard recombinant methodology. The protein and encoding polynucleotides are used in diagnosis and treatment of malignan tumours, haemopathy, HIV infection, immunological diseases and inflammation. The present sequence represents the human transcription regulation factor ZFM1 isomer 19.47 cDNA specific probe
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Human transcription regulation factor ZFM1 isomer 19.47 and encoding polynucleotide, used in diagnosis and treatment of malignant tumors, hemopathy, human immunodeficiency virus infection, immunological dise and inflammation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            03-JUL-2002
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ABL40964;

The protein has a molecular weight of 15 kD. The invention also relates to a method for the recombinant production of the protein, an antagonist of the protein, and the use of the protein, gene and antagonist in therapeutic applications. Red blood cell cytoplasmic protein 15.29 can be used in the treatment of a variety of diseases such as cerebral anoxia, respiratory adynamia, arrhythmia, intestinal palsy and anaemia. The present sequence represents a human red blood cell cytoplasmic protein 15.29 probe used in an exemplification of the invention
                                                                                                                                                                                                                                                                                  polynucleotide, and a method for preparing the polypeptide by DNA recombination. The application of the polypeptide is in treating arrhythmia and diabetes. Also disclosed are the antagonist against the polypeptide and its therapeutic action, and the application of the polynucleotide. The current sequence represents a human protein 10.01
                                                                                                                                                                                                        Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                     The invention relates to a human protein designated 10.01, cont 
Phe-His aminolyase active site. Also disclosed are the encoding
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Example
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   New human protein 10.01 containing Phe-His aminolyase acencoding polynucleotide, useful for treating arrhythmia
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    03-APR-2002.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           CN1342770-A.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Human; 10.01;

                                                                                                                                                                                                                                                                                                                                           The present invention discloses a polypeptide-guanosine triphosphatase activator protein-IO.01. The invention also discloses the method for curing several diseases, such as squamobasal cell carcinoma of skin, osteosarcoma, leukemia and teratoma by using said polypeptide. The present sequence represents a probe for guanosine triphosphate activations.
                                                                                                                                                                                                                                                                                                                                                                                                                                  A polypeptide-guanosine triphosphatase activator protein -10.01 polynucleotide for coding this polypeptide.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        мао Y,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              20-NOV-2002.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Primer PDJ33 is one of several primers which are preferred for use in amplifying inter-Alu regions of DNA. The amplified fragments are then subjected to 2-D electrophoresis on the basis of length and differences in base sequence. The resulting separation pattern is transferred to a filter for screening with a probe. The method can be used to detect genetic variation. See AAQ27339-Q27404 and AAQ33141-Q33144. (Updated on

The present invention describes human mPer3-10.01 a method for producing (I) using DNA recombination used in the treatment of several diseases, such as

DNA recombination diseases, such as

technology. (I) car vegetative nervous Also described hnology. (I) can

1 is 1 be

(I).

Novel polypeptide-human mPer 3-10.01 and polypeptide.

polynucleotide

for encoding

Example 6; Page 20 (Disclosure); 33pp; Chinese

                                                                                                                                                                                                                                                                                                                                                                                                                                                               The present invention describes human mPer3-10.01 (I). Also described is a method for producing (I) using DNA recombination technology. (I) can be used in the treatment of several diseases, such as vegetative nervous dysfunction, psychic disease, endocrinopathy, growth development disturbance disease and tumours. The present sequence represents a probe for (I), which is used in an example from the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         dysfunction, psychic disease, endocrinopathy, growth development disturbance disease and tumours. The present sequence represents a probe for (I), which is used in an example from the present invention

Serine proteinase 10 and its coding sequence can be used for treating diseases such as cancer and HIV infection. The present sequence is a probe, which was used in an example from the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Unidentified

The invention relates to methods and compositions for identifying individuals who have at least cone polymorphism in such drug metabolism; enzyme-encoding genes. The cone polymorphisms may be identified in a nucleic acid sample using probes or primers specific for a sequence selected from ABZ43217-ABZ50887 sucleic acid carrays and PCR-based methods. The invention also encompasses methods of cevaluating and screening drugs using genetic polymorphism data, particularly that relating to single nuclectide polymorphism data particularly that relating to single nuclectide complymorphism data are also useful as polymorphism markers for discovering genes in the above respects as they are stable in populations, and responses to crugs. SNPs are also useful as polymorphism markers for discovering genes in the above respects as they are stable in populations, occur frequently, and have lower mutation rates than other genome variations in genes encoding drug metabolising enzymes allows the customisation of crugs with the genetic profile of individual patients. The detection and analysis of polymorphisms cour reduce the likelihood of adverse reactions, thereby increasing safety. Methods of the invention are also useful in the drug discovery and experience in the invention are also useful in the drug discovery and approval processes. For example, individuals could be selected for capable of responding to a particular patient, but would also creduce the likelihood of adverse reactions, thereby increasing safety. Creduce the likelihood of adverse reactions the drug discovery and approval processes. For example, individuals could be selected for capable of responding to a particular drug or drug class, and previously failed drug candidates could be reviewed if they were matched with more capable of the invention may therefore lead to a na increase in the trange of the inventions of the inventions. The methods, d
                                                                                                                                                                                                                                                                                                                맑
                                                                                                                                                                                                                                                                                                                                                       S

CC to methods and compositions for identifying interviewed to one polymorphism in such drug metabolising enzyme-encoding genes. The compositions pecific for a sequence selected from ABZ4217-ABZ50887 using a cC variety of detection assays, including hybridisation assays, nucleic acid carrays and PCR-based methods. The invention also encompasses methods of CC evaluating and screening drugs using genetic polymorphism data. Genetic polymorphisms (SNPs), may be used in studying the relationship between CC polymorphisms (SNPs), may be used in studying the relationship between CC polymorphisms (SNPs), may be used in studying the relationship between CC that cause or exacerbate certain diseases, conditions, and responses to CC drugs. SNPs are also useful as polymorphism markers for discovering genes that cause or exacerbate certain diseases. SNPs are particularly useful CC in the above respects as they are stable in populations, occur in the above respects as they are stable in populations, occur in genes encoding drug metabolising enzymes allows the customisation of CC drug therapies based upon the genetic profile of individual patients. CC mis would not only take the guesswork out of selecting the drug with the CC greatest therapeutic effect for a particular patient, but would also reduce the likelihood of adverse reactions, thereby increasing safety. CC capable of responding to a particular drug or drug class, and previously failed drug candidates could be revived in the drug discovery and comportate patient populations. The methods, data and compositions of the invention may therefore lead to a an increase in the range of the inventions a patients are on medication and the number of different medications and the number of different medicati
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       27-DEC-2000; 2000JP-00399443.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Ś
                Sequences ABZ43217-ABZ50887 represent polymorphic sites within genes
CC encoding enzymes associated with drug metabolism. The invention relates
CC to methods and compositions for identifying individuals who have at least
CC one polymorphism in such drug metabolising enzyme-encoding genes. The
CC primers specific for a sequence selected from ABZ43217-ABZ50887 using a
CC variety of detection assays, including hybridisation assays, nucleic acid
CC arrays and PCR-based methods. The invention also encompasses methods of
CC evaluating and screening drugs using genetic polymorphism data, particularly that relating to single nucleotide
CC polymorphisms (SNPs), may be used in studying the relationship between
CC DNA sequence variations and human diseases, conditions, and responses to
CC drugs. SNPs are also useful as polymorphism markers for discovering genes
CC that cause or exacerbate certain diseases. SNPs are particularly useful
CC frequently, and have lower mutation rates than other genome variations
CC such as repeating sequences. The detection and analysis of polymorphisms
CC drug therapies based upon the genetic profile of individual patients.
CC This would not only take the genetic profile of individual patients.
CC greatest therapeutic effect for a particular patient, but would also
CC methods of the invention are also useful in the drug with the
CC methods of the invention are also useful in the drug with the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Identifying individuals having a polymorphism, useful for determining effectiveness or side effect of a drug or treatment protocol, comprise detecting at least one polymorphism in the drug metabolizing enzyme
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Nakamura
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   27-DEC-2000;

invention are also useful in the

discovery

Sequences ABZ43217-ABZ50887 represent polymorphic sites within genes encoding enzymes associated with drug metabolism. The invention relation methods and compositions for identifying individuals who have at one polymorphism in such drug metabolishing enzyme-encoding genes. The polymorphisms may be identified in a nucleic acid sample using probes primers specific for a sequence selected from ABZ43217-ABZ50887 using

have at learnes. The

relates least

probes or

Identifying individuals having a polymorphism, useful for determining the effectiveness or side effect of a drug or treatment protocol, comprises detecting at least one polymorphism in the drug metabolizing enzyme nucleic acid.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       approval processes. For example, individuals could be selected for clinical trials only if their genetic profiles indicate that they are capable of responding to a particular drug or drug class, and previously failed drug candidates could be revived if they were matched with more appropriate patient populations. The methods, data and compositions of the invention may therefore lead to a an increase in the range of possible drug targets and decreases in the number of adverse drug reactions, failed drug trials, the time taken for a drug to be approved, the length of time patients are on medication and the number of different medications a patient needs to take before finding an effective therapy
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Human; drug metabolising enzyme; gene; drug metabolism; poly drug evaluation; drug screening; genotyping; genetic profilitherapeutic customisation; adverse reaction; clinical trial;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  CC drugs. SNPs are also useful as polymorphism markers for discovering genes are that cause or exacerbate certain diseases. SNPs are particularly useful control in the above respects as they are stable in populations, occur frequently, and have lower mutation rates than other genome variations control in genes encoding drug metabolising enzymes allows the customisation of control in genes encoding drug metabolising enzymes allows the customisation of control in the particular particular patients. This would not only take the guesswork out of selecting the drug with the createst therapeutic effect for a particular patient, but would also concern the invention are also useful in the drug discovery and comproval processes. For example, individuals could be selected for colinical trials only if their genetic profiles indicate that they are capable of responding to a particular drug or drug class, and previously failed drug candidates could be revived if they were matched with more appropriate patient populations. The methods, data and compositions of the invention may therefore lead to a an increase in the range of compositions, failed drug trials, the time taken for a drug to be approved, the length of time patients are on medication and the number of different medications a patient needs to take before finding an effective therapy
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                S

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                variety of detection assays, including hybridisation assays, nucleic actic arrays and PCR-based methods. The invention also encompasses methods of evaluating and screening drugs using genetic polymorphism data. Genetic polymorphism data, particularly that relating to single nucleotide polymorphisms (SNPs), may be used in studying the relationship between DNA sequence variations and human diseases, conditions, and responses to drugs. SNPs are also useful as polymorphism markers for discovering genes

```
CC evaluating and screening drugs using genetic polymorphism data. Genetic CC polymorphism data, particularly that relating to single nucleotide CC polymorphism data, particularly that relating to single nucleotide CC polymorphisms (SNPs), may be used in studying the relationship between CC DNA sequence variations and human diseases, conditions, and responses to CC drugs. SNPs are also useful as polymorphism markers for discovering genes that cause or exacerbate certain diseases. SNPs are particularly useful in the above respects as they are stable in populations, occur frequently, and have lower mutation rates than other genome variations such as repeating sequences. The detection and analysis of polymorphisms CC in genes encoding drug metabolising enzymes allows the customisation of CC drug therapeutic effect for a particular patient, but would also reduce the likelihood of adverse reactions, thereby increasing safety. CC reduce the likelihood of adverse reactions, thereby increasing safety. CC dapproval processes. For example, individuals could be selecting they are CC capable of responding to a particular drug or drug class, and previously capable of responding to a particular drug or drug class, and previously failed drug candidates could be revived if they were matched with more cc appropriate patient populations. The methods, data and compositions of the invention may therefore lead to a nincrease in the rumber of adverse drug creations, failed drug trials, the time taken for a drug to be approved, the length of time patients are on medication and the number of different medications and the number of different the length of time patients are on medication and an effective theraps.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               one polymorphism in such drug metabolising enzyme-encoding genes. The polymorphisms may be identified in a nucleic acid sample using probes primers specific for a sequence selected from ABZ43217-ABZ50887 using variety of detection assays, including hybridisation assays, nucleic a arrays and PCR-based methods. The invention also encompasses methods of the compasses of the compas
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 encoding enzymes

CC variety of detection assays including hybridisation assays, nucleic acid CC variety of detection assays, including hybridisation assays, nucleic acid CC evaluating and screening drugs using genetic polymorphism data. Genetic CC polymorphism data, particularly that relating to single nucleotide CC polymorphism (analysis), may be used in studying the relationship between CC drugs. SNPs are also useful as polymorphism markers for discovering genes that cause or exacerbate certain diseases, conditions, and responses to CC in the above respects as they are stable in populations, occur crequently, and have lower mutation rates than other genome variations in genes encoding drug metabolishing enzymes allows the customisation of CC includes based upon the genetic profile of individual patients. CC This would not only take the guesswork out of selecting the drug with the greatest therapeutic effect for a particular patient, but would also comproved processes. For example, individuals could be selected for clinical trials only if their genetic profile of individual patients. CC daparoval processes. For example, individuals could be selected for clinical trials only if their genetic profiles indicate that they are capable of responding to a particular drug or drug class, and previously failed drug candidates could be revived if they were matched with more appropriate patient populations. The methods, data and compositions of the invention may therefore lead to a an increase in the range of compositions a patient needs to take before finding an effective therapy was medications a patient needs to take before finding an effective therapy.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         sequences ABZ43217-ABZ50887 represent polymorphic sites within genes encoding enzymes associated with drug metabolism. The invention relates to methods and compositions for identifying individuals who have at least one polymorphism in such drug metabolising enzyme-encoding genes. The polymorphisms may be identified in a nucleic acid sample using probes or primers specific for a sequence selected from ABZ43217-ABZ50887 using a variety of detection assays, including hybridication association.
                                                                                                                                                                                             Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Claim
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           detecting at least one polymorphism nucleic acid.

The invention relates to an isolated nucleic acid or alternate splice covariant comprising a nucleotide sequence containing at least one of the single nucleotide polymorphisms given in the specification, a nucleotide complement of them. The genes are ADAM19 (a disintegrin and metalloprotease 19, also known as gene 845), NRG2 (neuroregulin 2, also known as gene 847), endophilin 1 (also known as gene 874), endophilin 2 (also known as gene 874), endophilin 2 (also known as gene 874), endophilin 2 (also known as gene 874), also included care a vector comprising the isolated nucleic acid (or alternate splice variant), a host cell containing the vector, an isolated polypeptide composition typel motif 2, also known as gene 962). Also included care a vector comprising the isolated nucleic acid (or alternate splice variant), an encophilin 1 (alternate splice variant), an encophilin 2 (also known as gene 962). Also included care avector composition to composition the vector, an isolated polypeptide composition of composition to alternate splice variant), an exception of antibody fragment that binds to the polypeptide, and a carrier, complice variant, vector, polypeptide or antibody, and a carrier, composition of component to detecting a disintegrin and mucleic acid or alternate splice variant, antibody or antibody fragment, and at least one component to detect the hybridisation of the variant or the binding of the antibody to an ADAM gene amino acid sequence), a kit for detecting an interactor gene amino acid sequence), a kit for detecting an interactor gene amino acid sequence), a kit for detecting an ADAM or interactor gene amino acid sequence), a kit for detecting an ADAM or interactor gene amino acid sequence), a kit contained to detect the indirance and sequence (comprising the contained and acid sequence), a kit contained to the interactor gene amino acid sequence), a kit contained to the interactor gene amino acid sequence) of an orthologue of a human subject, determining an ADAM or interactor gene, treating an AD
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Keith T,

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       CC administering the pharmaceutical composition, a transgenic mouse (whose CC genome comprises an introduced null mutation in an endogenous gene that CC is orthologous to a human ADAM gene), making a homozygous transgenic Knockout mouse, forming a crystal of the isolated polypeptide, a cell CC line comprising the isolated nucleic acid or alternate splice variant, a CC biochip comprising the isolated nucleic acid or alternate splice variant, a CC nucleotides of the nucleic acid, an isolated antisense nucleic acid, an isolated nucleic acid, clientifying an ADAM or interactor gene ligand and an isolated nucleic acid, clientifying an ADAM or interactor gene ligand and an isolated nucleic acid or CC acid variant of Gene 803, 845, 847, 874 or 952. The nucleic acid or CC alternate splice variants, methods, kits and antibody/antibody fragment CC are useful for diagnosing and treating an ADAM or interactor gene cc associated disorder, e.g. asthma, atopy, obseity or inflammatory bowel CC disease. The present sequence is a SNP (single nucleotide polymorphism) CC containing region from one of the above mentioned genes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          0
```

```
New nucleic acid comprising a single nucleotide polymorphism at a specific location, useful in paternity testing, genetic analysis or diagnosing, preventing or treating cardiovascular diseases e.g. angioedema or angina pectoris.
```

SEQ ID 376pp; English.

CC (C1S), the alanyl aminopeptidase protein (ANDED), the meprin A, beta CC protein (MEPIB), the aminopeptidase protein (XPR), the meprin A, beta CC kallkrein protein (KLKI), the membrane bound aminopeptidase P protein (C (XPR)), the tissue (C (XPR)), the tissue (C (XPR)). The nucleic acid comprises at least one polymorphic position, CC (Including the alleles, reference alleles and alternate alleles of the CC single nucleotide polymorphisms, listed in the specification. The CC sequence of the gene. The polymorphic position residing in a coding consition resides within the untranslated composition resides within the untranslated region or an intronic region of the gene. The polymorphic position residing in a coding consition resides within the untranslated region or an intronic region of the gene. Constructing haplotypes using the nucleic acids above further comprises using the haplotypes to identify an individual for the presence of a disease phenotype, and correlating the presence of the disease constructing haplotypes to identify an individual for the presence of anilysis. The nucleic acids and polyperides can be used in diagnosing, correlating eracitovascular disease, primers and probes are comprised with the haplotype. The nucleic acids primers and probes are comprised mailysis. The nucleic acids and polypeptides can be used in diagnosing, correlating cardiovascular disease, e.g. andiocedema, angina pectoris, hypersension, heart failure, myocardial infarction, aneurysm, stroke, embolism, thrombosis, coronary artery disease or cancer. The cost of the invention.

CC arteriosclerosis, hypersensitivity reactions during haemodialysis. Cost the invention. The invention relates to an isolated nucleic acid (I) derived human gene encoding a protein, such as the C1, S subcomponent human gene encoding (C1S), the alanyl ar cid (I) derived from a S subcomponent protein

                                                                                                                                                        cc human gene encoding a protein, such as the C1, S subcomponent protein CC (C1S), the alanyl aminopeptidase protein (ANPP), the meprin A, beta C protein (MEP1B), the aminopeptidase P-like protein (XPN-PEPL), the tissue CK stalikrein protein (KUKI), the membrane bound aminopeptidase P protein (CC (SUCYIA2). The nucleic acid comprises at least one polymorphic position, cincluding the alleles, reference alleles and alternate alleles of the CC single nucleotide polymorphisms, listed in the specification. The CC single nucleotide polymorphisms, listed in the specification within the genomic sequence of the gene. The polymorphic position residing in a coding position results in a missense or silent mutation of the translated CC product of the gene. The polymorphic position residing in a non-coding position resides within the untranslated region or an intronic region of the gene. Constructing haplotypes using the nucleic acids above further CC of a disease phenotype, and correlating the presence of the disease phenotype with the haplotype. The disease phenotype is angioedema or an angioedema-like disorder. The nucleic acids, primers and probes are CC useful in phenotype correlations, paternity testing, medicine and genetic snalysis. The nucleic acids and polypeptides can be used in diagnosing, coronary acternosclerosis, hypersensitivity reactions during haemodialysis, constructive pulmonary diseases, inflammatory arthritis, asthma, chronic constructive pulmonary diseases, inflammatory allergies, or cancer. The nucleotion for the presence of the constructive pulmonary diseases, inflammatory allergies, or cancer. The nucleotion mucleotion during haemodialysis, the pulmonary diseases, inflammatory arthritis, asthma, chronic constructive pulmonary diseases, inflammatory allergies, or cancer. The nucleotide polymorphism, constructive pulmonary diseases, inflammatory arthritis, asthma, chronic constructive pulmonary diseases, inflammatory arthritis, asthma, chronic constructive pulmonary diseases, inflammatory arthritis, a

Claim 3; SEQ ID NO 207; 376pp; English.

CC human gene encoding a protein, such as the C1. S subcomponent protein CC (C1S), the alanyl aminopeptidase protein (ANPEP), the meprin A, beta CC protein (MEP1B), the aminopeptidase Prike protein (XPN-PEPL), the tissue CC (Allikrein protein (KIXI), the mebrane bound aminopeptidase P protein (XPNPEP2), or the soluble guanylate cyclase 1, alpha-2 subunit protein CC (GUCY1A2). The nucleic acid comprises at least one polymorphic position, CC including the alleles, reference alleles and alternate alleles of the Single nucleotide polymorphisms, listed in the specification. The CC single nucleotide polymorphisms, listed in the specification. The CC golymorphic position resides in a (non)coding position within the genomic Sequence of the gene. The polymorphic position residing in a coding CC position resides within the untranslated comprises using the haplotypes using the nucleic acids above further CC comprises using the haplotypes to identify an individual for the presence of a disease phenotype, and correlating the presence of the disease correlations, paternity testing, medicine and genetic analysis. The nucleic acids and polypeptides can be used in diagnosing, The invention relates ç an isolated nucleic acid (I) derived from s subcomponent protein

The
                                            A method has been developed for detecting the presence of a target site (TS), of at least one nucleotide (nt) in a nucleic acid (NA). The method comprises: (a) forming an oligonucleotide (ON), consisting of two fluorophores (F1, F2) each covalently linked to separate nt, bound to TS; and (b) detecting fluorescence energy transfer (FET) between F1 and F2 when ON is released from TS. The present sequence represents a synthetic polynucleotide used in an example of the present invention. The method is used to diagnose hereditary and other diseases; to determine infectious agents; in tissue typing for histocompatibility; in forensic identification and paternity testing, and in monitoring the genetic make up of plants and animals. Specifically it is used to detect single nt polymorphisms. The method provides inexpensive, simple, accurate and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Sequence 41 BP; 7 A; 14 C;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   AAT97406;

The invention relates to a novel method of estimating disease risk or cc prognosis of an individual by sequence polymorphism analysis, especially conjumorphisms in the human chromosome 19q. The invention further relates to estimating a treatment response of an individual suffering from cc cancer to a disease treatment; a primer or probe for use in the method of cestimating the disease risk or prognosis of an individual or for cestimating treatment; an antibody directed to an epitope of a RAI gene conjumors, and a kit for use in the method of estimating the disease risk or prognosis of an individual suffering the disease risk or prognosis of an individual or for estimating the disease risk or prognosis of an individual or for estimating a treatment, comprising at cleast one primer or probe and optionally amplifying means for nucleic carid amplification. The novel method is useful for estimating the disease risk or prognosis of an individual or for estimating a treatment response of an individual suffering from cancer to a disease treatment response of an individual suffering from cancer to a disease treatment response of an individual suffering from cancer to a disease treatment.
